1. What is a goal?

1. What is a goal?

1. What is a goal?

- Desired situation
- Described in terms of goal variables
- And in terms of desired goal values (max, min, target, target range, etc.)

What is a criterion?

What is an objective function?

Desirability of goal values

1. What is a goal?

- Desired situation
- Described in terms of goal variables
- And in terms of desired goal values (max, min, target, target range, etc.)

1. What is a goal?

Sometimes, one knows an exact relation between goal variable(s) and instrumental variables such that an objective function can be defined.

In a lot of economics, management science and operational research we assume such relations exist!!

We'll come back to this issue at the end of the presentation

1. What is a goal?

In Finance, we usually assume a *single goal*, e.g. the maximization of the value of the shares of the current shareholders or the maximization of expected utility.

Sometimes, maximization is *subject to constraints* (which then have absolute priority over the 'single' goal).

Financial Investment				

2.What is finance?

Integration needed!!!

Academic approaches

2. What is finance?

Finance research focus over the decades

- seminal : narrative descriptive finance
restrictive focus on instruments / institutions
: institutional decision context
- 1950s : finance as decision science
Markowitz' Portfolio Theory
- 1960-70s : OR ramification of fin.economic decision problems
: OR techniques
- 1975 ff : sophisticated econometric descriptive finance
statistical behavior of financial market prices
: outcomes of aggregate decisions

To what extent can insights from descriptive finance
serve as guidelines for financial decisions in practice ?

2. What is finance?

To what extent can insights from descriptive finance serve as guidelines for financial decisions in practice ?

- Depends on validity of assumptions wrt ‘average’ actors and wrt functioning markets and wrt ‘context’ in general for the actual ‘non-average’ actors and their context
- Sometimes the distance between average and non-average is not so big. Then theory may become very powerful: Look for instance at the success of Option Pricing Theory!

6. Conclusions

3. Average Decision Makers (Descriptive modelling)

introducing.... :

the representative
decision maker !

3.Average Decision Makers

3. Average Decision Makers

- self-interested behavior, non-satiation
 - efficient market hypothesis
 - time preference
 - risk aversion
 - diversification
 - risk-return trade-off
- ↓
- no-arbitrage : exclude sure profits at no cost :
normative portfolio revision
 - equilibrium : market clearing :
descriptive portfolio composition
- ↓

3. Non-Average Decision Makers

- common denominators, but
- each decision situation requires a specific tailored solution :

113. Baker and Bestor's Staple

114. Brotherton's Arched Barb

115. Claw's Crossover Lock

120. Locke's Loop Lock

121. Nadelhoffer's Crossover

122. Preston's Long Barb

116. Edenborn's Locked-in Barb

117. Ford's Kink and Wrap Barb

118. Glidden's Heavy Duty

119. Kelly's Swing Barb

123. Riter's Visible

124. Upham's Lazy 'S'

125. Waco Twist

126. Wilkes' Two Staple

3.Non-Average Decision Makers

3.Non-Average Decision Makers

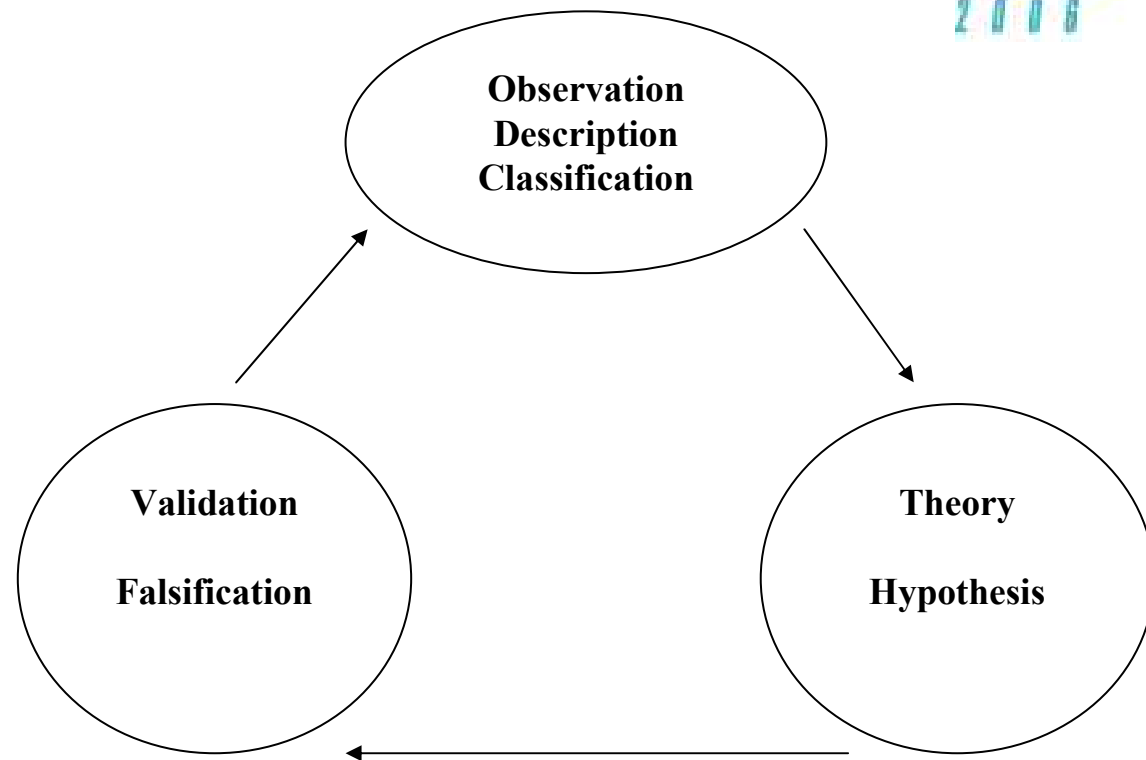

Expected utility maximizing homo economicus ?

- set of choice alternatives :
not fixed / dynamic / constraints
- description of choice alternatives :
multiple attributes / representation of uncertainty
incomplete information / limited data processing
may change by learning
- representation of preference structure :
may change over time / by learning
- decision criterion :
satisfying / attainable result

6. Conclusions

5. Why multiple goals in finance

A. The Firm

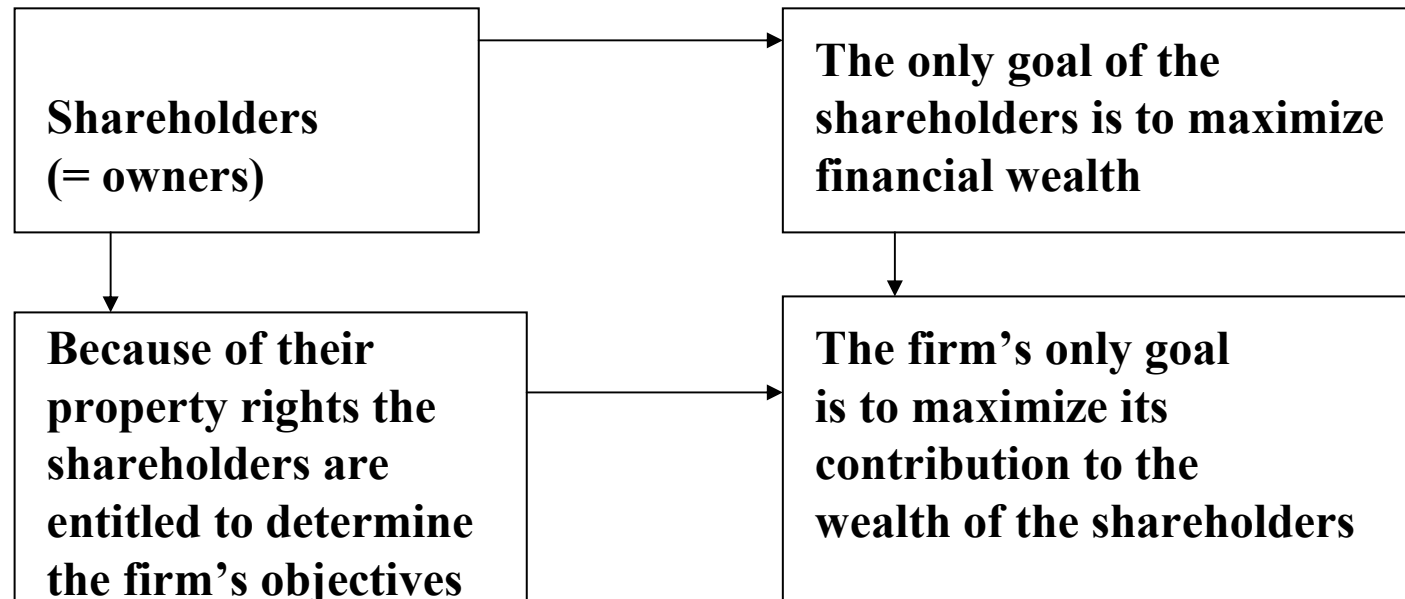

B. The Investor

C. (Risk Management)

5. Why multiple goals in finance: The firm

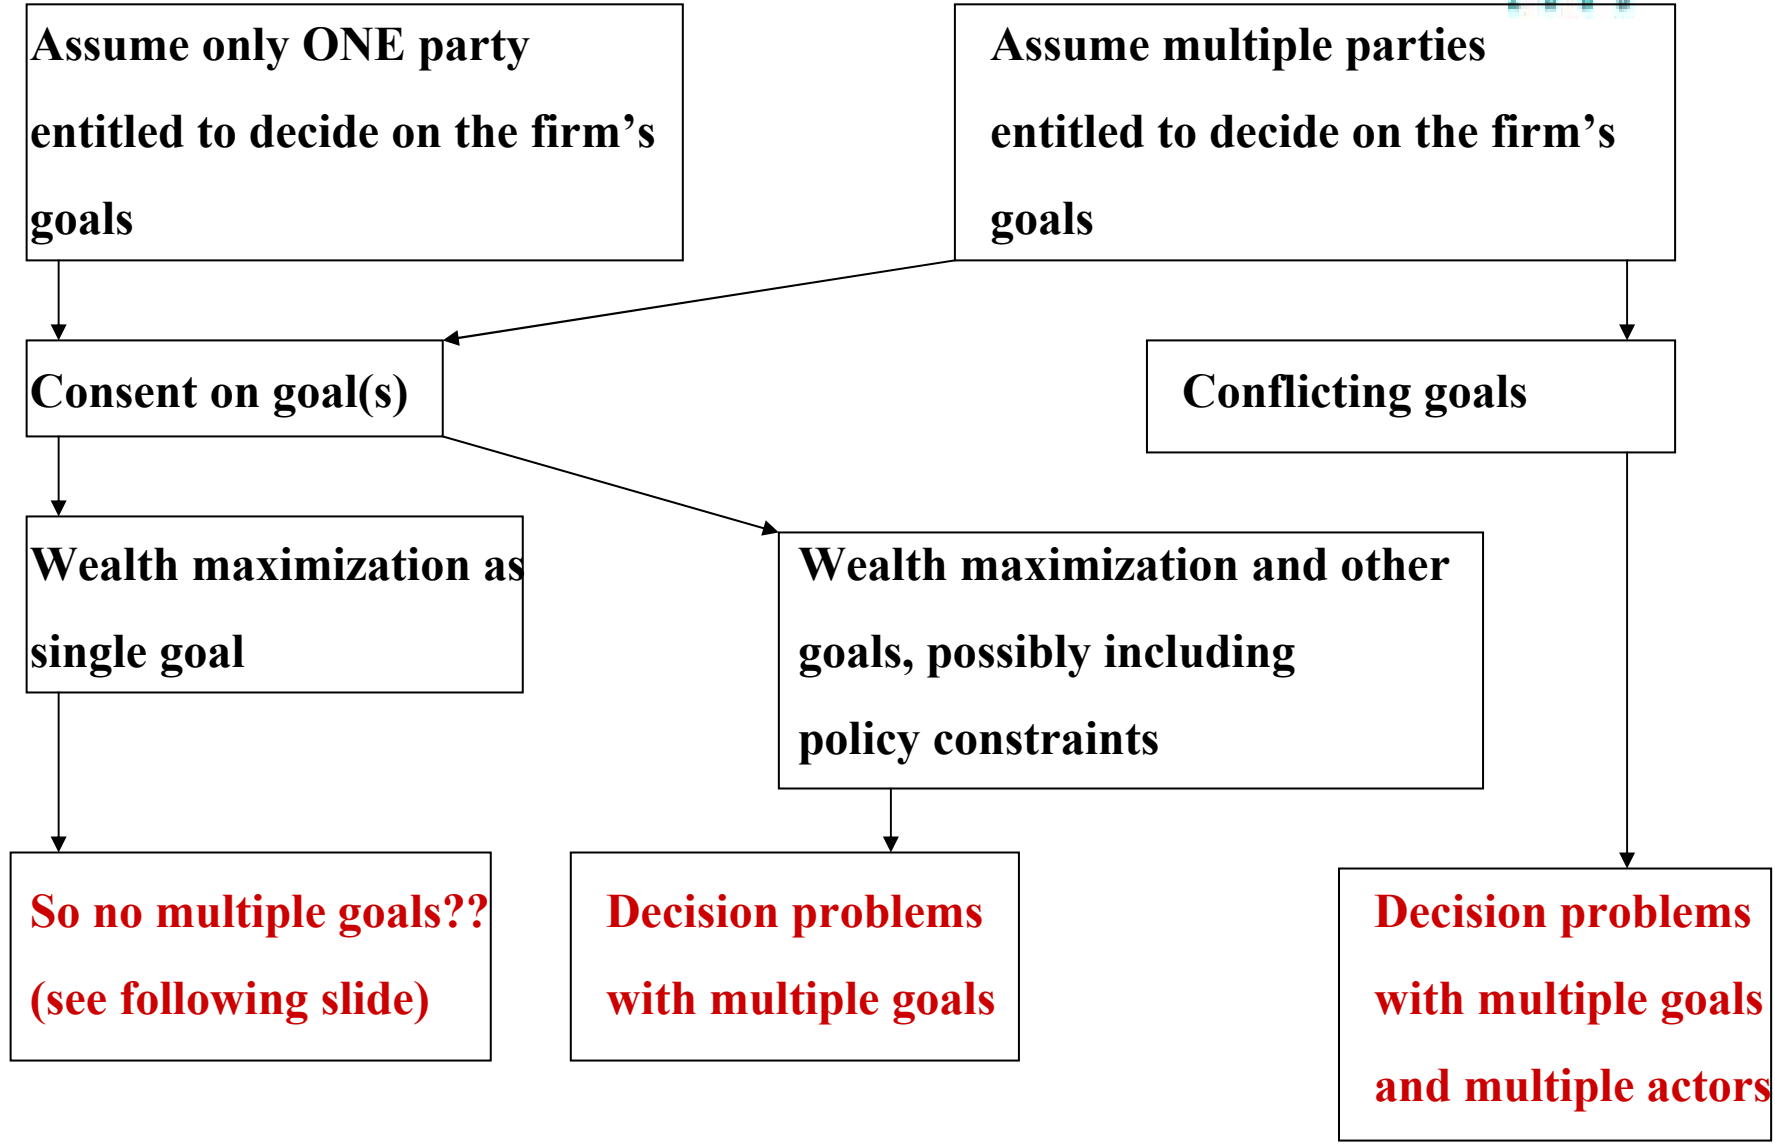

Neo-classical view

- This view is embedded in large framework of stylized thinking in economics and law: (general equilibrium, property rights theory, limited liability shareholders, etc.).
- However, the societal impact of the firm and its governance structure is a growing topic of debate and discussion.

5. Why multiple goals in finance: The firm

5. Why multiple goals in finance: The firm

- Assume only ONE party entitled to decide on the firm's goals
- Consent on goal: Wealth maximization as single goal
- So no multiple goals??

Provided: claims well defined

If not, possibility of games:
your results depends on decisions by others, internal & external

Provided: clear picture of cash flows

If not, often multiple risk measures
e.g. exposure estimates

Provided: financial markets as benchmark

If not, individual decision context or market circumstances may bring more goals

Otherwise: Decision problems with multiple goals!

5. Why multiple goals in finance?
6. **Conclusions**

6. Conclusions

- **Most problems in finance involve multiple goals**
- **Often there are no easy solutions: (in)(visible) (hand)(icap)**
- **Decision makers are confronted with dynamic goal complex**
- **Limitations of goals-instruments thinking**
- **Modern decision and performance evaluation technologies have a lot to offer – and so do many insights from financial theory and from empirical studies**
- **However:**
 - There is a lot to win by integrating these approaches!**
- **Decision makers do and have to take positions.**

Call for integration

JOHANNES KEPLER'S UPHILL BATTLE

5. Why multiple goals in finance: The investor

The case for a single goal:

Neo-classical finance: Maximize expected utility with utility defined in terms of future wealth or holding period return and the utility function is confronted with the probability distribution of future investment returns

Markowitz Equates risk with variability of portfolio returns, which is then measured by (co-) variance or standard deviation

Assuming Quadratic utility and/or specific characteristics of the pdf's

Reasons for multiple goals

- **Distinguish between downside risk and upside potential ('a matter of taste', asymmetric return distributions)**
- **Returns may be viewed as being generated by several underlying state variables. One may then want to use multidimensional risk profiles composed of the sensitivities for unexpected changes in these state variables**
- **Personal decision context, e.g. tax or liquidity considerations**
- **'Stylish' attributes, such as firm size. P/E, B/P, CF/P, etc.**
- **Asset allocation issues such as country or region, industry, etc.**
